KEYMACRO is used for defining your own macro. It is particularly useful for accessing namespaces. You can also define variable accessors. A variable, once defined, can be referenced by NAME This is the name of the variable. TYPE This is the type of the variable. DIMENSION This is the dimension of the variable. This can be either 0, 1 or 2. A DIMENSION-0 variable is a variable that only has one possible value. A DIMENSION-1 variable is a variable that can only take on one value, but that value can take on a limited set of values. A DIMENSION-2 variable is a variable that can have any number of different values. STATEMENT This is the statement associated with the variable. KEYMACRO This is a statement that is similar to the GOTO statement of BASIC. It can jump you to the given statement. (Note that you can use the KEYMACRO to move within a Java class.) Example 1: The following statement is equal to the following statement, because they are the same statement: Example 2: This statement is not equal to the statement: Example 3: KEYMACRO can also be used to initialize a variable to a specific value. For example: Example 4: RESTRICTED_VALUE This variable is equal to the statement: Example 5: Although this variable looks like it is initialized to a constant, it is not. It is equal to the following statement: Example 6: Finally, another popular way to initialize a variable is with the following statement: Example 7: Java Reserved Words The following are Java reserved words and cannot be used as identifiers. They are used for the syntax of the language. do while if try catch finally switch instanceof synchronized throws const abstract assert break continue for static goto this switch while do continue for default for break not if this default for for do 77a5ca646e
